

# $(3n+1)$ -Conjecture

August 13, 2020

## 1 # Python Program to check the $(3n+1)$ Conjecture

Powered by: Dr. Hermann Völlinger, DHBW Stuttgart(Germany); August 2020

See Wikipedia: [https://en.wikipedia.org/wiki/Collatz\\_conjecture](https://en.wikipedia.org/wiki/Collatz_conjecture)

The Collatz conjecture is a conjecture in mathematics that concerns a sequence defined as follows: start with any positive integer  $n$ . Then each term is obtained from the previous term as follows: if the previous term is even, the next term is one half of the previous term. If the previous term is odd, the next term is 3 times the previous term plus 1.

The conjecture is that no matter what value of  $n$ , the sequence will always reach 1.

The conjecture is named after Lothar Collatz, who introduced the idea in 1937, two years after receiving his doctorate.[1] It is also known as the  $3n + 1$  problem, the  $3n + 1$  conjecture, the Ulam conjecture (after Stanisław Ulam), Kakutani's problem (after Shizuo Kakutani), the Thwaites conjecture (after Sir Bryan Thwaites), Hasse's algorithm (after Helmut Hasse), or the Syracuse problem.[2][4] The sequence of numbers involved is sometimes referred to as the hailstone sequence or hailstone numbers (because the values are usually subject to multiple descents and ascents like hailstones in a cloud),[5][6] or as wondrous numbers.[7]

Paul Erdős said about the Collatz conjecture: "Mathematics may not be ready for such problems." [8] He also offered US\$500 for its solution.[9] Jeffrey Lagarias in 2010 claimed that based only on known information about this problem, "this is an extraordinarily difficult problem, completely out of reach of present day mathematics." [10]

## 2 Problem Solution

1. Create a function `collatz` that takes an integer  $n$  as argument.
2. Create a loop that runs as long as  $n$  is greater than 1.
3. In each iteration of the loop, update the value of  $n$ .
4. If  $n$  is even, set  $n$  to  $n/2$  and if  $n$  is odd, set it to  $3n + 1$ .
5. Print the value of  $n$  in each iteration.

## 3 Program Explanation

1. The user is asked to input  $n$ .
2. The sequence is printed by calling `collatz` on  $n$ .

```
[1]: # Program/Source Code
# Here is the source code of a Python program to test Collatz conjecture for a
# → given number.
# The program output is shown below.

def collatz(n):
    while n > 1:
        print(n, end=' ')
        if (n % 2):
            # n is odd
            n = 3*n + 1
        else:
            # n is even
            n = n//2
        print(1, end='')

n = int(input('Enter n: '))
print('Sequence: ', end='')
collatz(n)
```

```
Enter n: 260955
Sequence: 260955 782866 391433 1174300 587150 293575 880726 440363 1321090
